Apprendre à une intelligence artificielle à jouer à Snake en utilisant un algorithme génétique

Marilou Bernard de Courville

Nº SCEI 40091

June 5, 2024

### Introduction

### Problématique et pertinence au regard du thème de l'année

- Le jeu de Snake: piloter un serpent sur une grille dans le but de manger des pommes, sans rentrer dans les murs ni se replier sur soi-même.
- ▶ **Objectif:** mettre en place une intelligence artificielle pouvant jouer efficacement au jeu de Snake, apprenant de manière autonome.
- ▶ Le moyen d'y parvenir: utiliser un algorithme génétique, qui s'inspire de l'évolution naturelle pour entraîner un réseau de neurone opérant les décisions de mouvement du serpent dont les entrées sont des paramètres de vision.
- ▶ Les réseaux de neurones: Warren S. McCulloch et Walter Pitts, A logical calculus of the ideas immanent in nervous activity, 1943, comparent les neurones à seuil binaire à la logique booléenne puis Frank Rosenblatt, The perceptron: a probabilistic model for information storage and organization in the brain, 1958, introduit la notion de poids
- ▶ L'algorithme génétique: développé par John Holland dans les années 1970, il s'inspire de l'évolution naturelle pour résoudre des problèmes d'optimisation

## Le jeu de Snake

### Brève histoire et règles du jeu

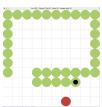

**Origine:** borne d'arcade *Blockade*, créée par Gremlin en 1976, popularisé par Nokia en 1997 sur mobile

### Règles du jeu:

- Le serpent débute avec une longueur initiale donnée sur un échiquier entouré d'un mur et contenant une pomme.
- L'objectif est de le faire grandir en mangeant des pommes.
- Chaque pomme consommée augmente sa longueur d'une unité et fait apparaître une nouvelle pomme à un emplacement aléatoire.
- ► Le joueur dirige le serpent à l'aide des touches directionnelles du clavier ← ↑ ↑ ↓ → .
- Le jeu se termine si le serpent heurte un mur ou son propre corps.
- Le score du joueur est égal au nombre de pommes mangées.

## Déplacer le serpent

### Grâce à un réseau de neurones

Idée: utiliser un réseau de neurones multicouches à propagation avant pour déterminer le mouvement du serpent.

- Entrées: paramètres de vision.
- Sorties: les directions ← ↑ ↓ .

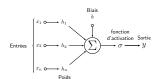

Modélisation d'un neurone: somme pondérée des entrées par un poids synaptique auguel on ajoute un biais. Sortie générée par une fonction d'activation non linéaire

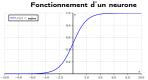

$$\mathbf{x} = (x_1, \dots, x_n)^\mathsf{T}, \mathbf{h} = (h_1, \dots, h_n)^\mathsf{T}$$
  
 $y = \sigma (\mathbf{h}^\mathsf{T} \mathbf{x} + b)$ 

Généralisation à un réseau multicouches: modélisation matricielle avec fonction vectorielle  $\sigma$ 

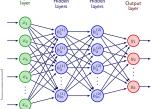

$$\begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_m \end{pmatrix} = \sigma \begin{bmatrix} \begin{pmatrix} h_{1,1}^{(2)} & h_{1,2}^{(2)} & \cdots & h_{1,k}^{(2)} \\ h_{2,1}^{(2)} & h_{2,2}^{(2)} & \cdots & h_{2,k}^{(2)} \\ \vdots \\ \vdots & \vdots & \ddots & \vdots \\ h_{m,1}^{(2)} & h_{m,2}^{(2)} & \cdots & h_{m,k}^{(2)} \end{pmatrix} \sigma \begin{pmatrix} \begin{pmatrix} h_{1,1}^{(1)} & h_{1,2}^{(1)} & \cdots & h_{1,m}^{(1)} \\ h_{2,1}^{(1)} & h_{2,2}^{(2)} & \cdots & h_{1,m}^{(2)} \\ \vdots & \vdots & \ddots & \vdots \\ h_{k,1}^{(1)} & h_{k,2}^{(2)} & \cdots & h_{k,n}^{(2)} \end{pmatrix} \begin{pmatrix} x_1 \\ y_2 \\ \vdots \\ y_m \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ h_{k,k}^{(2)} & \cdots & h_{k,n}^{(2)} \end{pmatrix} \begin{pmatrix} x_1 \\ y_2 \\ \vdots \\ y_m \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(2)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} + \begin{pmatrix} b_1^{(1)} \\ b_2^{(1)} \\ \vdots \\ b_k^{(n)} \end{pmatrix} +$$

### Conclusion

Annexe I: Snake game: code en

# Évaluation de la performance d'un serpent

**Objectif:** mesurer la performance d'un serpent grâce à une fonction de fitness.

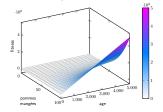

Paramètres: taille du serpent (pommes mangées) et âge (mouvements effectués) à la fin du jeu.

Fonctions de fitness évaluées: maximiser  $f_1$  ou  $f_2$  favorise la croissance et la longévité des serpents.

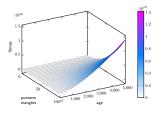

- $f_1(taille, age) = taille^3 \times age$
- $f_2(\text{taille}, \text{age}) = (2 \times \text{taille})^2 \times \text{age}^{1.5}$

### Astuces:

- Pour éviter les boucles infinies: un nombre de points de vie est attribué à chaque serpent, décrémenté à chaque mouvement et réinitialisé à chaque pomme mangée. Á 0, le serpent meurt et son âge est pénalisé dans le calcul de la fitness
- Pour favoriser une croissance rapide: f1 est utilisée au début du jeu. Ensuite on passe à f2 qui valorise la survie du serpent pour manger plus de pommes.

$$\text{fitness } f(\mathsf{taille}, \mathsf{age}) = \mathsf{taille}^3 \times \mathsf{age}$$

 $\begin{array}{l} \text{fitness} \\ f(\text{taille}, \text{age}) = (2 \times \text{taille})^2 \times \text{age}^{1.5} \end{array}$

### Conclusion

Annexe I: Snake game: code en python

# Optimiser les décisions du serpent

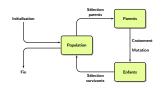

### Entrainement du réseau de neurones par algorithme génétique

**Principe:** approche évolutionniste d'une population de réseaux de neurones par algorithme génétique

- Sélection de parents par la "sélection roulette": chaque serpent a une certaine chance d'être choisi en fonction de sa fitness.
- Croisement des serpents sélectionnés par paires aléatoire (parents) en K points (ici K=2) pour recomposer la population totale en générant des enfants.
- Mutation par ajustement mineur aléatoire dans le chromosome de chaque serpent pour maintenir la diversité.

### Formalisation de la mutation:

- $p_m = 0.1$  probabilité de mutation,
- $c_m = 0.1$  le coefficient de mutation,
- $\forall h_i(t)$  à l'itération t, on tire  $U \sim \mathcal{U}(0,1)$  et  $C \sim \mathcal{U}(-1,1)$
- Si  $U < p_m$ ,  $h_i(t+1) = h_i(t) + C \times c_m$ sinon  $h_i(t+1) = h_i(t)$ .

Processus itératif

Croisement 2 points (2 points crossover)

Remarque: L'amélioration de la fitness est garantie à chaque génération mais pas la convergence vers un optimum global.

## Résultats de convergence

Convergence des stratégies de vision n°1 et n°2

- Observation: la stratégie de vision n°2 converge plus rapidement que la stratégie n°1, et atteint un score de fitness plus élevé.
- ▶ Interprétation: la stratégie de vision n°2 fournit au serpent des informations plus pertinentes pour localiser et atteindre la pomme.

### Conclusion

Le ieu de Snake

Algorithme

- Deux outils informatiques de modélisation et d'optimisation sont mis en œuvre pour jouer de manière autonome au jeu de Snake:
  - Des réseaux de neurones afin de prendre des décisions de mouvement, dont les entrées sont des informations visuelles.
  - Des algorithmes génétiques pour optimiser les poids et biais des réseaux de neurones
- Dans les deux cas, ces outils sont inspirés de la nature, grande source d'inspiration pour l'ingénierie.
- ► Tous les programmes ont été implémentés en python avec une interface graphique pygame sans librairie annexe permettant une visualisation en temps réel de l'optimisation de la population de serpents.
- Différentes stratégies de vision et de fitness ont été proposées et discutées en terme de pertinence et performance.
- Des pistes d'amélioration restent à explorer:
  - Optimisation de la conception du réseau de neurones.
  - Utiliser une fonction de fitness dynamique pour mieux prendre en compte les contraintes de la taille du serpent.

Various rules to create a neural network:

- \* The number of hidden neurons should be between the size of the  $\hookrightarrow$  input layer and the size of the output layer.
  - \* The number of hidden neurons should be 2/3 the size of the input
- $\hookrightarrow\,$  layer, plus the size of the output layer.
  - \* The number of hidden neurons should be less than twice the size of the input layer.
  - \* The number of hidden neurons should be between the size of the input layer and the output layer.
    - \* The most appropriate number of hidden neurons is sqrt(input layer nodes \* output layer nodes)

```
if strategy == 1:
```

# Neural network composed of 4 layers, input layer has 24

→ neurons, 2 hidden layers each with 18 neurons, output

→ layer has 4 neurons (4 directions)

# in total it has 24 + 18 + 18 + 4 = 64 neurons.
